Naked Egg Lab

Background Info:
Vinegar has a pH level of 2 very Acidic. Eggs have a pH level of 8 almost neutral base.

Problem:
Would placing an egg (almost neutral base) in vinegar (strong acid) make the egg become rubber like?

Hypothesis:
Tell me your hypothesis and what you think will happen to the Egg when placed in Vinegar and WHY?

Materials Needed:
Plastic Cup
Egg
Vinegar
Beaker with Water
Graduated Cylinder

Procedures:
List out all the steps you took. Make sure you number the steps 1- Whatever. Make sure your steps are clear enough to where I can repeat your lab based on your steps and come up with the same results. (All steps should be on a separate sheet of paper with your name on it)
